

Without an accurate physical inventory, an SRM suite is essentially worthless.

- Inability to recover lost or stranded assets
- Inability to determine network capacity and current resource utilization
- Inability to properly plan network growth
- Inability to manage the network effectively
- Inability to rapidly recover from network outages
- **LOST REVENUE!!!**

Complete **"Field Audit"** inventory solution. Highly trained technical field personnel. Personally verify equipment and connectivity by physical site audit. Complete inventory solution:

- Radio Frequency
- Switches
- Routers
- DACS
- DSX panels
- Circuit Paths
- Microwave
- Leased Facilities

Inventory Control & Management

A physical asset inventory can be an extremely difficult project to complete using internal resources. Many organizations encounter difficulties motivating, training and supervising personnel, keeping data up to date and accurate, completing the project on time and on budget, keeping up with "day-to-day tasks" and most of all, knowing what to do with asset information once it has been collected.

Baseline Fixed Asset Inventory

DataField's services ensure quality results and customer satisfaction the first time, on time, and on budget. These processes and methodologies have developed from our experience completing inventories of all types. DataField services are further customized to each specific customer to ensure the most appropriate, accurate data in the most efficient and effective manner possible.

DataField Teams are trained and experienced in all aspects of performing physical inventories using bar coded and non-bar coded technology. We use tested procedures for room entry and assessment, systematic searching to avoid missing assets, and other tools and methods to collect accurate asset details.

Inventory Control Services include the following features:

- **Geographical:** Location and other geographic details are collected as specified by the client. DataField can also apply location bar codes for future reconciliation audits and tracking MAC's (Moves, Adds and Changes). These details can be defined and negotiated as necessary during the planning stage of the project.
- **Asset Detail:** Existing Asset Number, Suffix Number, Description, Model Number, Serial Number (if applicable), Manufacturer, Group/Classification Identification and other details can be collected during the inventory and from existing data.

When complete, the Fixed Inventory Service will provide your company an accurate, turnkey system, populated with data that's ready to go. Your company can be assured of ongoing, 100% compliance. You are now ready to critically evaluate your assets, and how and where these assets are utilized.
